Product Description

Impregum Soft is a polyether impression material that is mixed by hand and is available in heavy-bodied, medium-bodied and light-bodied consistency. The base paste to catalyst ratio is 7:1 by volume.

To ensure adequate adhesion to the tray, use Polyether Adhesive/Polyether Contact Tray Adhesive. This adhesive can be used on metal or methacrylate trays, but not with vinyl/polysiloxane impression materials.

ca: These Instructions for Use should be kept for the duration of product use.

The product may only be used when the product labeling is clearly readable. For details on all additionally mentioned products please refer to the corresponding Instructions for Use.

Intended Purpose

Intended purpose: dental impression material.

Intended users: educated dental professionals who have theoretical and practical knowledge on usage of dental products.

Patient target group: all patients requiring dental treatment, unless the patient's condition limits the use.

Clinical benefit: create a precise reproduction of the clinical situation within dental workflows.

Indications

• All types of precision impressions

Contraindications

Polyether impression materials are contraindicated for use with patients who have a known allergy to polyether impression materials or contained allergens, as listed in section Precautionary Measures.

Precautionary Measures

For Patients

The base paste and catalyst paste of this product contain substances that may cause an allergic reaction by skin contact in certain individuals. If prolonged contact with oral mucosa occurs, large amounts of water, if an adverse reaction is observed in a patient discontinue use of the product and seek medical attention as needed.

Known allergens are 1-Dodecylimidazole, mint flavors and Sulfonium salt.

For Dental Personnel

The base paste and catalyst paste of this product contain substances that may cause an allergic reaction by skin contact in certain individuals. To reduce the risk of allergic response, minimize exposure to these materials. In particular, avoid exposure to uncured product. If skin contact occurs, wash skin with soap and water. Use of protective gloves and a no-touch technique is recommended.

Potential Undesirable Side Effects and Complications

Potential effects are local irritations, or local or systemic allergic reactions. In rare cases impression material can be swallowed or aspirated. Swallowing of impression material can cause harm to the gastrointestinal tract. As the impression material cures in the mouth of the patient, it is possible that loose teeth or restorations are removed with the impression material.

Please report a serious incident occurring in relation to the device to 3M and the local competent authority (EU) or local regulatory authority.

3M Safety Data Sheets/Safety Information Sheets can be obtained from www.3M.com or contact your local subsidiary.

Preparation

Block-out undercuts or areas where gingival recession exists to prevent the impression material from "locking" onto the tooth structure. Failure to block-out may make tray removal difficult, or cause extraction of natural teeth or prostheses.

Impression Tray:

Any impression tray generally used for precision impressions are suitable. For sufficient adhesion, apply a thin layer of Polyether Adhesive/Polyether Contact Tray Adhesive to the tray and allow to dry completely according to the Instructions for Use.

Retraction

Aluminum hydroxide/gel or aluminum sulfate-based solutions are suitable retraction agents. Retracting using cords or rings containing ephedrine (ephedrine + 8-hydroxy quinoline sulfate and iron (II) sulfate) can interfere with the setting of polyether impression materials.

• Keep the areas from which the impression is to be taken dry.

• For subgingival preparations use cords or rings as necessary.

• Before taking the impression, thoroughly rinse and dry the area to remove the rest of the retraction agent.

Dosing and Mixing

Place strands of base paste and catalyst of equal length on a mixing pad. Using too much or not enough catalyst will affect the working time, but will adversely affect the quality of the impression.

• Mix the pastes with a spatula for about 45 seconds. Wipe any unmixed paste remaining on the spatula on the edge of the pad; pick up the pastes again and spread it until it is a uniform color. Never mix by stirring, as bubbles may form.

Times

These working times apply at 23°C/74°F. Higher temperatures decrease the total working time, lower temperatures increase it.

	Heavy-Bodied Consistency	Medium-Bodied Consistency	Light-Bodied Consistency
mixing	min:sec	min:sec	min:sec
Working from beg. of mixing	00:45	00:45	00:30
Setting from beg. of mixing	05:30	06:00	06:00
Time in the mouth*	03:00	03:30	03:00

* When products are combined, the longer time applies.

Taking the Impression

Using the filling device, fill the Elastomer Syringe with the mixed paste of Impregum Soft medium-bodied consistency.

Then fill the tray prepared with Polyether Adhesive/Polyether Contact Tray Adhesive.

Syringe the sulcus or cavity from the deep part out. Always keep the tip of the intraoral tip immersed in the material and touching the tooth surface during application.

Immediately after syringing, position the filled tray in the mouth and hold it there without pressure until the material has set.

Double-Mix Technique

Using this filling device, fill the Elastomer Syringe with the mixed paste of Impregum Soft light-bodied consistency.

Then fill the tray prepared with Polyether Adhesive/Polyether Contact Tray Adhesive.

Syringe the sulcus or cavity from the deep part out. Always keep the tip of the intraoral tip immersed in the material and touching the tooth surface during application.

Immediately after syringing, position the filled tray in the mouth and hold it there without pressure until the material has set.

Functional Impression

Fill the tray prepared using adhesive with Impregum Soft heavy-bodied or medium-bodied or Impregum Soft medium-bodied consistency. Position the tray in the mouth and have the patient make functional movements.

If necessary, use Impregum Soft light-bodied consistency subsequently for detailed impressions.

After Impression Taking

Thoroughly examine and explore the sulcus off the prepared teeth and surrounding dentition. Remove any residual cured impression material from the mouth.

ESPE

Hygiene

Place the impression in a standard disinfectant solution commonly used for impressions for the period of time recommended by the manufacturer. Excessive disinfection may damage the impression.

After disinfection, rinse the impression under running water for approx. 15 sec.

Pouring a Model

Prepare a cast from the impression with a commercial specialized stone plaster no earlier than 30 min and no later than 14 days after taking the impression.

To avoid introducing bubbles into the model, briefly pre-rinse with water and dry with air before pouring. Do not use surfactants as these impair the quality of polyether impressions and are not necessary!

Polyether impressions can be silver-coated, whereas copper-coating is not feasible.

Fin previsto

Pre visto: material de impresión dental.

Users previstos: personal especializado que disponga de conocimientos teóricos y prácticos sobre la manipulación de productos dentales.

Grupo objetivo de pacientes: todos los pacientes que requieren tratamiento dental, salvo aquellos pacientes cuyas condiciones limite su uso.

Uso clínico: crear una reproducción precisa de la situación clínica nos consultas dentales.

Indicaciones

• Todos los tipos de impresiones de precisión

Contraindicaciones

Las mezclas de impresión a base de polímero están contraindicadas para el uso en pacientes con alergia conocida a los materiales de impresión a base de polímero o que contengan alérgenos. Por favor, consulte la sección Medidas de Precaución.

Specificaciones para Product Use

Before use of the tube, put on new, unused disposable gloves during all clinical applications.

The material should be applied in advance to prevent contamination during the treatment.

Cleaning and Disinfection

Multiple Use and Cleaning of Medical Device

The presences Instructions of Use deben conservarse durante todo el tiempo de utilización del producto. El producto solamente debe utilizarse cuando la etiqueta del producto pueda leerse con claridad. Para los demás productos mencionados, favor, consulte las instrucciones correspondientes.

Limpieza y desinfección

Uso múltiple y limpieza de dispositivos médicos

Si el tubo no estuvo estérilmente limpio después del uso, es decir, si, al contrario de lo que se esperaba, se contaminó con sangre o saliva durante el trato, no se debe usar.

• Las presencias Instructions of Use deben conservarse durante todo el tiempo de utilización del producto. El producto solamente debe utilizarse cuando la etiqueta del producto pueda leerse con claridad. Para los demás productos mencionados, favor, consulte las instrucciones correspondientes.

Especificaciones para el uso del producto

Antes de utilizar el uso, usa guantes nuevos desecharables (no usados) durante todas las aplicaciones clínicas del tubo para reducir el riesgo de contaminación.

El material debe aplicarse previamente para prevenir la contaminación durante el tratamiento.

Limpieza

El tubo no debe colocarse en un baño desinfectante ni en un dispositivo de limpieza-desinfección (lavador/desinfector). Se puede llevar a cabo una limpieza superficial del tubo como parte de la higiene, esto es, en caso de que haya, por ejemplo, polvo en el entorno (sucedido no significa contaminación con saliva, sangre, secreciones, etc.).

• Los lavabos de CavitWipes™ tienen la capacidad de desinfectar el tubo.

• Los lavabos de CavitWipes™ basados en alcohol y compuestos cuaternarios también pueden utilizar materiales equivalentes.

• Los lavabos de CavitWipes™ basados en agua y sales de cobre y sulfato de cobre.

• Los lavabos de CavitWipes™ basados en agua y sales de cobre y sulfato de cobre.
